

FINTRACK

Smart Personal Finance & Expense Tracking Mobile App UI/UX Case Study

Problem Statement

Managing personal finances can be challenging due to the increasing number of daily digital transactions. Many users struggle to understand where their money is being spent, how much budget remains for the month, and which spending categories contribute most to their expenses.

FINTRACK was designed to simplify expense tracking by providing clear financial summaries, quick expense entry, organized transaction history, and visual spending insights. The goal was to create a clean and intuitive experience that helps users make informed financial decisions with minimal effort.

User Flow

Splash Screen → Sign Up / Sign In → Dashboard → Add Expense → Transaction History → Analytics → Profile & Settings

The flow was designed around the primary user goal: recording expenses quickly while maintaining visibility into spending patterns and account settings. This follows the required application flow outlined in the assignment brief.

Key Design Decisions

1. Splash Screen

UX Goal: Establish brand identity and create a clear entry point.

User Problem: Users need immediate recognition of the application's purpose.

Design Decisions:

- Used a minimal splash screen with strong branding.
- Applied a dark navy gradient to communicate trust, reliability, and financial stability.
- Included a concise value proposition to reinforce the product's purpose.

2. Authentication (Sign Up & Sign In)

UX Goal: Provide frictionless account access.

User Problem: Users should be able to create or access an account quickly without unnecessary complexity.

Design Decisions:

- Limited the forms to essential fields only.
- Used large call-to-action buttons to improve discoverability.
- Maintained a clean layout to reduce cognitive load during onboarding.

3. Dashboard

UX Goal: Deliver instant financial clarity.

User Problem: Users need to understand their current financial status at a glance.

Design Decisions:

- Prioritized the "Budget Remaining" card as the primary element.
- Included a spending progress indicator to visualize budget consumption.
- Displayed top spending categories to highlight major expenses.
- Added recent transactions for quick access to recent financial activity.
- Kept the floating action button persistent for fast expense entry.

4. Add Expense

UX Goal: Enable fast and effortless expense recording.

User Problem: Users often avoid tracking expenses when the process feels time-consuming.

Design Decisions:

- Made the amount field the dominant visual element.
- Used category icons to support quick recognition and selection.
- Pre-filled the current date to reduce manual input.
- Provided a simple one-action saving process.

This aligns with the assignment requirement of minimizing friction during expense entry.

5. Transaction History

UX Goal: Help users review and manage past financial activities.

User Problem: Users need a structured way to locate previous transactions.

Design Decisions:

- Grouped transactions by month to improve scanability.
- Used color differentiation for income and expenses.
- Presented merchant name and transaction dates for quick identification.
- Maintained consistency with dashboard components and navigation.

6. Analytics

UX Goal: Transform financial data into actionable insights.

User Problem: Raw transaction lists make it difficult to identify spending patterns.

Design Decisions:

- Highlighted total monthly spending as the primary metric.
- Included month comparison data to support spending awareness.
- Used a category breakdown chart to visualize spending distribution.
- Added percentage values to improve readability and comparison.

This supports the objective of providing visual insights instead of raw numbers.

7. Profile & Settings

UX Goal: Provide account management and personalization options.

User Problem: Users need control over budgets, categories, and application preferences.

Design Decisions:

- Separated budget settings from application preferences.
- Included category management and budget alert controls.
- Added personalization features such as currency and language preferences.
- Maintained consistent card-based layout for familiarity across the application.

Outcome

The final solution provides a complete expense management experience that enables users to:

- Track and manage expenses efficiently.
- Monitor monthly budgets and spending behavior.
- Review transaction history with clarity.
- Understand spending patterns through visual analytics.
- Manage account and budget preferences from a centralized settings area.

The design focuses on simplicity, visual hierarchy, and usability while meeting the functional requirements outlined in the FinTech product design brief.
